ABOUT ME

Final Semester BSc Computer Science student at **BRAC University** (2026) with a strong interest in **AI, data, and human-centered technology**. I enjoy working on deep learning, HCI research, full-stack web development, and building practical software solutions. My undergraduate thesis on smart menu systems focused on how technology can influence user behavior and decision-making.

TECHNICAL SKILLS

Languages	: Python, C, C++, Java, SQL
CS Concepts	: Data Structures: Arrays, Linked Lists, Stacks, Queues, Trees, Graphs, Hash Tables, Algorithms: Dynamic Programming, Greedy, BFS/DFS
	: OS: Process Scheduling, Memory Management, Concurrency, Deadlocks, Networks: TCP/IP, OSI Model, Routing, Socket Programming
	: Databases: SQL, ER Modeling, Normalization, Software Engineering: OOP, Design Patterns, Agile, UML
AI / ML	: AI: Search Algorithms, Heuristics, Knowledge Representation, Deep Learning: Neural Networks, CNN, Attention U-Net
	: Computer Vision: Image Filtering, Edge Detection, Segmentation, Data Science: Feature Engineering, EDA, Scikit-learn, XGBoost
Tools	: Figma, Git, GitHub, Jupyter Notebook, VS Code, MS Office Suite
Cloud & Lang.	: AWS Cloud Foundations, English: Professional Proficiency, Bengali: Native

EDUCATION

BRAC University <i>BSc in Computer Science — School of Data and Sciences</i>	Dhaka, Bangladesh 2022 – 2026 (Expected)
Govt. Syed Hatem Ali College, Barishal <i>HSC — Science</i>	Barishal Board 2020 GPA: 5.00 / 5.00
Barishal Zilla School <i>SSC — Science</i>	Barishal Board 2018 GPA: 5.00 / 5.00

PROJECTS

SmartPlate — HCI-Driven Smart Menu System	<i>Figma, HCI, Thematic Analysis, Behavioral Design</i>	BSc Thesis (CSE400) · Jan 2026
- The core question was simple: does the way a menu looks actually change what people eat? I designed three versions (Traditional, Info-Lite, Info-Rich) and tested them with 50 survey responses and 20 sit-down interviews at BRAC University’s cafeteria. - The Info-Rich menu, which showed waste data and sustainability cues alongside each dish, pushed sustainable food choices from 22% to 58% and cut stated waste intention by 32%. Thesis approved by BRAC University, graded A-.		
Save Lives — Blood Donation Platform	<i>React, Node.js, Express.js, MongoDB, JWT</i>	GitHub
A platform where donors register their location and blood group, and people in need can search nearby, message donors directly, or submit requests to blood banks — all gated behind JWT authentication with separate user and admin roles.		
Brain Tumor Segmentation	<i>Python, TensorFlow, Keras, OpenCV</i>	GitHub
Trained an Attention U-Net on the BRISC2025 brain MRI dataset to mark tumor boundaries at the pixel level. Switched from cross-entropy to Dice Loss because the tumor region is tiny compared to the background — standard loss just ignored it.		
Health Risk & Student Dropout Classification	<i>Python, Scikit-learn, XGBoost, Pandas</i>	GitHub
Two separate ML studies: predicting patient health risk from clinical data (with Z-score outlier removal), and predicting student dropout from weekly VLE interaction logs. Ran five classifiers on each and compared them with ROC-AUC and PR curves.		
Mini Virtual File System	<i>C, Linux</i>	GitHub
Wrote a working filesystem from scratch in C that runs on top of raw binary disk images — superblock, inode table, bitmap allocation, directory entries, and CRC32 checksums for catching corruption.		
Endless Runner Game (OpenGL)	<i>Python, PyOpenGL, GLUT</i>	GitHub
A 3D lane runner where the environment speeds up as your score climbs. Health system, three coin tiers, four power-ups, a day/night sky cycle, and an animated character — all drawn with immediate-mode OpenGL, locked at 60 FPS.		
Event Planner Web Application	<i>PHP, MySQL, HTML, CSS</i>	GitHub
A web app where planners create events, build timetables, track budgets, and manage participants — while participants get a clean read-only view of everything. Full CRUD operations on a MySQL backend.
